EDUCATION

PhD in Economics and Finance, University of Verona — 2027 (expected)
– Visiting Scholar, University of Mannheim — 2023–2024
MSc in Economics, Universitat de Barcelona — 2022
BSc in Economics, Universitat Pompeu Fabra — 2020

FIELDS

Primary Fields: Empirical Industrial Organization, Competition Policy and Antitrust

Secondary Fields: Health Economics, Applied Econometrics, AI Applied to Economics

PERSONAL DETAILS

Citizenship: Spanish

Languages: Spanish (native), Catalan (native), English (C1), Italian (B2)

TEACHING EXPERIENCE

Artificial Intelligence for Research (main instructor; 12-hour course for MSc and PhD students), University of Huelva — 2026
Industrial Organization (Teaching Assistant), University of Verona — 2023

RELEVANT POSITIONS

Intern, Berkeley Research Group, Brussels (European Competition practice) — 2024–2025

FELLOWSHIPS AND AWARDS

Innova Award to the Young Researcher with the Best R&D&i Project (PhD), Universitat Rovira i Virgili — 2026

Awarded for the paper "Pay for Delay: Preventing Competition in Pharmaceutical Markets", within the PhD-Student Workshop in Industrial and Public Economics (WIPE).

Young Talent Competition Award, Lear Competition Festival — 2025

Awarded for the paper "Pay for Delay: Preventing Competition in Pharmaceutical Markets"; prize for young researchers in competition law, economics, and regulation.

Doctoral Fellowship, University of Verona — 2022–2026

ADDITIONAL TRAINING

Demand Estimation (A. Pakes, J. Gortmaker), Causal Inference Workshop — 2024

CRESSE Summer School on Competition Policy and Regulation — 2023

Center for Competition Policy Summer School in Platform Economics — 2023

PRESENTATIONS

2026: XL Jornadas de Economía Industrial (Málaga), EARIE Annual Conference (Mannheim), BSE PhD Jamboree, Barcelona School of Economics (Barcelona), EuHEA Seminar Series (online), CRES Seminar, Universitat Pompeu Fabra (Barcelona), WIPE Workshop on Industrial and Public Economics (Reus)

2025: XXXIX Jornadas de Economía Industrial (Santander), Lear Competition Festival (Rome), EARIE Annual Conference (Valencia), Centre for Competition Policy Seminar (London), CCP Conference on Frontiers of Competition and Regulation (London)

WORKING PAPERS

The Consumer Cost of Pay-for-Delay: Evidence from the U.S. Testosterone Market (Job Market Paper)

Revise and Resubmit, Journal of Industrial Economics

This paper quantifies consumer harm from the Pay-for-Delay agreement that delayed generic entry into the U.S. Testosterone Replacement Therapy market from 2006 until 2015. I estimate a two-level nested logit demand model on monthly product-level data, recover marginal costs from Bertrand-Nash first-order conditions, and simulate counterfactual earlier generic entry by augmenting the choice set with fictitious generics and solving for equilibrium prices. Earlier entry would have made generics available at prices 43–50% below branded levels. Total consumer damages amount to $6,451 million, a 43.6% consumer surplus increase. The supply-side analysis shows that the agreement was highly profitable for the branded manufacturer.

AI Meets Econometrics: A Multi-Model Evaluation of LLM Pedagogical Quality

Revise and Resubmit, International Review of Economics Education

This paper evaluates the pedagogical quality of three frontier large language models – Claude Sonnet 4.5, GPT-5, and DeepSeek-V3 – as study aids for undergraduate econometrics. Twenty-nine questions from a standard undergraduate textbook, covering OLS, panel data, instrumental variables, and time series, are submitted to each model under identical prompts. Responses are scored with a seven-dimension rubric that separates technical correctness from pedagogical quality. All three models score highly on accuracy, completeness, and terminology, so factual reliability no longer

discriminates between frontier systems. The differences emerge in technical clarity, explanatory clarity, and pedagogical usefulness: Claude leads overall, especially on computational questions; GPT performs best on conceptual questions; and DeepSeek consistently underperforms despite comparable accuracy. The pedagogical risk of AI-assisted learning therefore lies not in incorrect content but in the quality of the explanation that accompanies correct answers, and the best model depends on the type of task.

When Does the "Generic Paradox" Occur? Evidence from Therapeutic Class Heterogeneity

Standard theory predicts that prices fall as the number of competitors increases, yet the evidence on how generic entry affects branded drug prices is mixed: some studies find that branded prices rise after entry (the "Generic Paradox"), others that they fall. This paper asks whether heterogeneity across therapeutic classes explains these divergent findings and offers the broadest empirical test of the paradox to date. Using data on more than 475 branded products in two major therapeutic classes (C09 and C10), I apply the Callaway and Sant'Anna (2021) difference-in-differences estimator to measure the effect of generic entry on branded prices and market shares. The results diverge sharply: in C10 branded prices rise by about 50% after 30 quarters, while in C09 they fall by 20–40% after 20 quarters. Branded market share erodes in both classes, but within 10 quarters in C09 versus about 20 in C10. The Generic Paradox is therefore therapeutic-class specific, and the mixed prior evidence reflects genuine heterogeneity across markets rather than conflicting estimates of a single effect.

AI Meets Antitrust: How Large Language Models Reshape Market Concentration

Large language models are becoming a primary interface for consumer product discovery, yet little is known about how their recommendations relate to actual market structure. This paper provides the first empirical benchmark of LLM brand recommendations against market shares. Using 1,429 responses from three frontier models (GPT-4o, Claude Sonnet 4, Gemini 2.5 Flash Lite) across sixteen U.S. consumer categories, I compare the implied concentration of recommendations with retail-value shares from Euromonitor Passport 2024. In fragmented markets such as skincare, LLMs concentrate recommendations on fewer brands than market shares would suggest; in concentrated markets such as headphones, they spread them across more brands. Both patterns reflect a single phenomenon: LLM recommendations live in a concentration band roughly one third as wide as the real market's, regardless of where the market sits. Top recommendations also tilt toward specialist and premium brands that hold only two thirds of the share of actual category leaders. Findings are stable across the three models.

Can Divestitures Undo Cartel Damage? Evidence from the Teva-Allergan Merger

This paper examines whether structural remedies can reverse the price effects of collusion. It exploits a unique overlap in the U.S. generic pharmaceutical industry, where a subset of molecules were simultaneously affected by the 2013–2015 generic price-fixing cartel and subject to the mandatory divestitures imposed by the Federal Trade Commission in the 2016 Teva-Allergan merger. By comparing the price evolution of molecules that were cartelized only, divested only, or both, the paper evaluates whether the divestitures restored competitive pricing precisely in the markets where prior collusion had elevated prices above competitive levels.
